Room Heating Tips.

Be certain that windows are shut tightly.

Don't forget the upper section of the window.

Windows that are not completely closed allow cold air into the room.

If your windows won't shut properly call

Facilities Management at x8280 to report the problem.

Closing you window shades or
draperies can help keep the cold out.

Don't place heat producing lamps
or other appliances near the thermostat
as this can fool the thermostat into
reducing the heat supplied to the room.

Be certain that nothing blocks the air into
or out of the vents on the heating unit as this
prevents the unit from heating the rooms air.

The heat for Kyle dorm is supplied
by a boiler in the basement of the building.
The boiler burns natural gas.

The boiler heats water which is pumped through
each room's heating radiator. After the water
gives up it's heat it flows back to the boiler to
be heated again.

The system works in the same way as a house. A
thermostat senses the buildings temperature and
switches the boiler on when the building cools down.
The thermostat shuts off the boiler when the building
warms up. The occupants can adjust the
temperature up or down to suite their needs.

There are two thermostats, one by the kitchen the other
is in the "addition". The thermostat by the kitchen
Controls the main section of the house while
the thermostat in the "addition" serves that area.

Each room radiator has it's own knob to regulate the
space temperature. Occupants can adjust the valve.
For more heat turn valve handle counter clockwise,
for less heat turn valve handle clockwise.
(When viewed from top.)

College policy for heating in occupied times 68-72°.
Temperatures are limited by the automation system
to a maximum heating temperature of 72° and not
lower than 64°.
