The Joys of Being a Statistician and Cancer Researcher

ABSTRACT

I will discuss my career path as I moved from physics to biostatistics and cancer research. I will discuss some lessons I have learned and opine on the value of statistical thinking in science, on being a card-carrying statistician, and on the importance of also being a subject-matter expert. I will exemplify these lessons with examples from my research in statistical methods and my cervical cancer research, along with my experience being a member of cervical cancer screening guidelines committees.
